-!- FUNCTION: Activates NF-kappaB via Bcll0 and IKK.

-!- SUBUNIT: CARD14 and Bcll0 bind to each other by CARD-CARD interaction (By similarity).

-!- SUBCELDULAR LOCATION: Cytoplasmic (By similarity).

-!- SUBCELDULAR LOCATION: Cytoplasmic (By similarity).

                                                                                                                                                                                                                                         INTERACTULAR LOCATION: Cytoplasmic.
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- TISSUE SPECIFICITY: Detected in adult peripheral blood leukocytes, thymus, spleen and liver. Also found in promyelocytic leukemia HL-60 cells, chronic myelogenous leukemia K562 cells, Burkitt's lymphoma Raji cells and colorectal adenocarcinoma SW480 cells. Not detected in HeLa Si, Molt-4, A549 and G431 cells. Not detected in HeLa Si, Molt-4, A549 and G431 cells.
-!- SIMILARITY: CONTAINS I PDZ/DHR DOMAIN.
-!- SIMILARITY: CONTAINS I GRAD DOMAIN.
-!- SIMILARITY: CONTAINS I GUANYLATE KINASE-LIKE DOMAIN.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         9 GDALLEQISVIGGNLTGIFIHRVTPGSAADQMALRPGTQIVMVDYEASEPLFKAVLEDTT 68
                                                         Gaide O., Martinon F., Micheau O., Bonnet D., Thome M., Tschopp J.;
FEBS Lett. 505:198-198(2001).
-!- FUNCTION: Activates NF-kappaB via Bcl10 and IKK. Stimulates the
phosphorylation of Bcl10.
-!- SUBUNIT: CARD11 and Bcl10 bind to each other by CARD-CARD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               16-0CT-2001 (Rel. 40, Created)

-I ALTERNATIVE PRODUCTS: 4 ISOFORMS; Al (SHOWN HERE), Cl, A2 AND C2;
ARE PRODUCED BY ALTERNATIVE SPLICING AND ALTERNATIVE INITIATION.
-I TISSUE SPECIFICITY: THIS PROPERIN IS FOUND IN EPITHELIAL CELL
JUNCTIONS. ISOFORM AL IS ABUNDANT IN THE HEART AND BRAIN WHEREAS
ISOFORM CL IS EXPRESSED AT HIGH LEEVEL IN THE KIDNEY, PANCREAS,
HEART AND PLACENTA. IN BRAIN AND SKELETAL MUSCLE, ONLY ISOFORM AL
IS DETECTABLE. ISOFORM CL IS FOUND IN NORMAL AS WELL AS IN MOST
IN NORMAL TISSUE.

IN NORMAL TISSUE.

SUBUNIT: THIS DIOXYGENASE SYSTEM CONSISTS OF FOUR PROTEINS: THE
TWO SUBUNITS OF THE HYDROXXIASE COMPONENT (BPHA AND BPHE), A
FERREDOXIN (BPHF) AND A FERREDOXIN REDUCTASE (BPHG).
SIMILARITY: TO OTHER BACTERIAL RING-HYDROXYLATING DIOXYGENASE
FERREDOXIN REDUCTASE COMPONENTS.

II;
Submitted (JAN-1998) to the EMBL/GenBank/DDBJ databases.
-- FUNCTION: DEGRADES SHORT-LIVED REGULATORY AND ABNORMAL PROTEINS IN
PRESENCE OF ATP. HYDROLYZES TWO ATPS FOR EACH PEPTIDE BOND CLEAVED
IN THE PROTEIN SUBSTRATE (BY SIMILARITY).
-- CATALYTIC ACTIVITY: Hydrolysis of large proteins such as globin,
cassin and denaturated servim albumin, in presence of ATP.
-- SUBUNIT: HOWOTETRAMER (BY SIMILARITY).
-- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
-- SIMILARITY: BELONGS TO PEPTIDASE FAMILY S16.

                                                                            The present sequence is human caspase recruitment domain-14 (CARD-14). The CARD-14 gene is located on chromosome 17. The CARD-14 is used for the detection of modulators that modulates the ability of CARD-14 to bind to Bcl-10 and stimulates phosphorylation of Bcl-10 or activation of nuclear factor-kappa B (NF-kB). The CARD-14 is useful for regulating growth and cell death and useful for the treatment of cancer. It is also useful for the treatment of cancer. It is also useful for the treatment of autoimmune disorders (e.g., systemic lupus erythematosus), neurological disorders e.g., Alzheimer's and Parkinson's disease, inflammatory disorders, haematological disorders barkinson's disease, inflammatory disorders, haematological infactions, strokes, immune disorders (e.g., candromes), myocardial infactions.

                                                                                       The present sequence is predicted human caspase recruitment domain-14 (CARD-14). The CARD-14 gene is located on chromosome 17. The CARD-14 is used for the detection of modulators that modulates the ability of CARD-14 to bind to Bol-10 and stimmlates phosphorylation of Bol-10 or activation of nuclear factor-kappa B (NF-kB). The CARD-14 is useful for regulating growth and cell death and useful for the treatment of autoimmune disorders (e.g., systemic lupus erythematosus), neurological disorders e.g., Alzheimer's and Parkinson's disease, inflammatory disorders, haematological disorders and parkinson's disease, inflammatory disorders, haematological disorders strokes, immune disorders (e.g., Crohn's disease, allergic rhinitis), cell signalling disorders and certain viral and bacterial infections.
An isolated caspase recruitment domain polypeptide useful for regulating growth and cell death and useful for the treatment of cancer

```
The present sequence represents novel human caspase recruitment domain, CARD-11. The polynucleotide encoding this sequence was isolated from a human T-cell CDAR library. Also described are converted to a human and the carborate and CARD-9 and CARD-10 (AMU01205, AMU01206).

The sequences for CARD-9, CARD-10 and CARD-11 interact and rat CARD-9 (AMU01204). CARD-10 and CARD-11 interact with Bol-10 which is thought to activate nuclear factor (NF) kappaB and apoptosis. The sequences of the invention can be used for treating a disorder associated with abnormal levels of apoptosis by modulating the expression or activity of CARD-10, or CARD-11.

They can be used for the treatment of hyperproliferative disorders (e.g. cancer), autoimmune disorders (e.g. systemic lupus erythematosus), neurological disorders (e.g. Alzheimer's disease), inflammatory disorders (e.g. Crohn's disease), and viral infection (e.g. HIV). The CARD CARD can be used in screening and detection assays (e.g. chromosomal)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel caspase recruitment domain (CARD) proteins, CARD-9, CARD-10, CARD-11, useful as targets for therapy, as immunogens, and in screening and detection assays -

                                                                                                                                                           2;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated plakoglobin interacting polypeptide (I). (I) is useful as a medicament and in the manufacture of a medicament plakoglobin related diseases, such as skin carcinoma or an acantholytic disease, and oscreen compounds that interfere with the interaction of the polypeptide with plakoglobin The plakoglobin related diseases include basal cell carcinoma, squamous cell carcinoma, extramammary Paget's disease, Naxos disease, heart diseases, skin blistering and acantholytic diseases such as subcorneal acantholysis, Grover's disease, Hailey'Hailey's disease or Darier's disease, and ectodermal dysplasia/skin fragility syndrome. AAU73245-
                The
mapping, tissue typing), predictive medicine (prognostic assays, monitoring clinical trials, and therapy (treatment and prophylaxis). The CARD polypeptide may be used to screen for drugs that bind to and/or modulate it. CARD sequences are potential targets for regulating inflammation. cancer, NF kappab signalling, stress related response and apoptosis in human disease. A host cell containing a polynucleotide encoding CARD can be used to create transgenic animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                          cardiant;
                                                                                                                                                                                                    Gaps

The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been scolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a polypeptide encoded by a full length human cDNA of the invention.

Note: The sequence data for this patent did not form part of the printed
                                                                                                                                                                                                                                                                                                                                                                                                                                                   3
Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                    \text{C.N.S} disorders. Note: The sequence data for this patent did not form part of the printed

The present sequence represents novel human caspase recruitment domain, CARD-10. The polynucleotide encoding this sequence was isolated from a human skin CDAR library. Also described are novel human sequences from a human skin CDARD-11 (AAU01205, AAU01207) and rat CARD-9 (AAU01204).

CARD-9, CARD-10 and CARD-11 interact with Bcl-10 which is thought to activate nuclear factor (NF)-kappaB and apoptosis. The sequences of the invention can be used for treating a disorder associated with abnormal levels of apoptosis by modulating the expression or activity of CARD-9, CARD-10, or CARD-11. They can be used for the treatment of hyperproliferative disorders (e.g. cancer), autoimmune disorders (e.g. Alzheimer's disease), inflammatory disorders (e.g. Crohn's disease), and an antibody which selectively binds to CARD can be used in screening and detection assays (e.g. chromosomal mapping, tissue typing), conductive medicine (prognostic assays, monitoring clinical trials, and therapy (treatment and prophylaxis). The CARD polypeptide may be used to screen for drugs that bind to and/or modulate it. CARD sequences are potential targets for requiating inflammation, cancer, NF kappaB corrected response and apoptosis in human disease. A host call containing a polynucleotide encoding CARD can be used to create transgenic animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel caspase recruitment domain (CARD) proteins, CARD-9, CARD-10, CARD-11, useful as targets for therapy, as immunogens, and in screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             2 DSFYIRVNLAMEGRAKGE-LQVHCNEVLHVTDTMFQGCGCWHAHRVNSYTMKDTAAHGTI 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated plakoglobin interacting polypeptide (I). (I) is useful as a medicament and in the manufacture of an addicament for treating plakoglobin related diseases, such as skin carcinoma or an acantholytic disease, and to screen compounds that interfere with the interaction of the polypeptide with plakoglobin related diseases include basal cell carcinoma, squamous cell carcinoma, extramammary Paget's disease, Naxos disease, heart diseases, skin blistering and acantholytic diseases such as subcorneal acantholysis, Grover's disease, Hailey's disease or Darier's disease, and ectodermal dysplasia/Skin fragility syndrome. Au/73245-AAU73254 represent novel human plakoglobin interacting protein amino acid sequences and related sequences of the invention.
                                                                                                                    Human; plakoglobin; cytostatic; osteopathic; dermatological; cardiant; plakoglobin related disease; skin carcinoma; acantholytic disease; basal cell carcinoma; squamous cell carcinoma; Naxos disease; extramammary Paget's disease; hard disease; skin blistering; subcorneal acantholysis; Grover's disease; Hailey Hailey's disease; Darier's disease; ectodermal dysplasia; skin fragility syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New polypeptide, useful for treating skin carcinoma or acantholytic disease such as Grover's and Darier's disease, comprises a protein interacting with human plakoglobin and involved in transduction of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        2 DSFYIRVNLAMEGRAKGE-LQVHCNEVLHVTDTMFQGCGCWHAHRVNSYTMKDTAAHGTI 60

The present invention describes a method for examining ischaemic conditions, comprising measuring the expression levels of particular genes (I) in a test sample or determining the expression profile of a gene group in the sample comprising genes selected from (I). The method is useful for examining the ischaemic condition (e.g. compression profile) or expression levels of particular genes (AB199202 to AB19912, encoding the protein sequences in ABB57020 to ABB57374) or by determining the expression profile of a gene group comprising these genes. The expression levels or expression profiles produced by these genes are used as an indicator when screening for ischaemic condition-improving drugs or therapeutics for ischaemic diseases. AB199913 and AB199914 represent PCR primers for a mouse ischaemic condition related sequence, which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Examining the ischemic condition (e.g. occlusive ischemia) by measuring expression levels of particular genes defined in the specification or by determining the expression profile of a gene group comprising these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      õ
                                                                                                                                                                                                                                                                                                                        The invention relates to diagnosing endometrial cancer in a subject suspected of having endometrial cancer comprising determining the expression of a set of nucleic acid molecules or expression products in an endometrial sample suspected of being cancerous, where the set of nucleic acid molecules comprises at least 2 nucleic acid molecules comprises at least 2 nucleic acid molecules captured from 50 fully defined sequences as given in the specification. The nucleic acids are used as an array of at least 2 of the 50 nucleic acids bound to a solid substrate. Also included is a solid-phase protein microarray comprising at least 2 antibodies or its antigen protein microarray comprising at least 2 antibodies or its antigen properties from the 50 fully defined sequences as given in the specification, fixed to a solid substrate. The methods and arrays are specification, fixed to a solid substrate. The methods and arrays are treatment regimes and identification of lead compounds useful for the treatment of endometrial cancer. The present sequence is one of 50 proteins differentially expressed between cancerous and non-cancerous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ?
                                                                                                                                                                                                                                                  Diagnosing endometrial cancer comprises determining expression of nucleic acid molecules or expression products that are differentially expressed in normal and malignant endometrium \,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from brosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).
The sequence acta for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; plakoglobin; cytostatic; osteopathic; dermatological; cardiant; plakoglobin related disease; skin carcinoma; acantholytic disease; basal cell carcinoma; squamous cell carcinoma; Naxos disease; extramammary Paget's disease; hart disease; skin blistering; subcorneal acantholysis; Grover's disease; Hailey 'Hailey's disease; Darier's disease; ectodermal dysplasia; skin fragility syndrome.

                                                                                                                                                                                                                                                                                                                                                5;
                                                                                                                                                                     The invention relates to an isolated plakoglobin interacting polypeptide (I). (I) is useful as a medicament and in the manufacture of a medicament for treating plakoglobin related diseases, such as skin carcinoma or an acantholytic disease, and to screen compounds that interfere with the interaction of the polypeptide with plakoglobin related diseases include basal cal carcinoma, squamous cell carcinoma, extramammary Paget's disease, Naxos disease, heart diseases, skin blistering and acantholytic diseases such as subcorneal acantholysis, Grover's disease, Hailey's disease or Darier's disease, and ectodermal dysplasialyskin fragility syndrome. AAU73245 - AAU73254 represent novel human plakoglobin interacting protein amino acid sequences and related sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                   New polypeptide, useful for treating skin carcinoma or acantholytic disease such as Grover's and Darier's disease, comprises a protein interacting with human plakoglobin and involved in transduction of plakoglobin related signal to nucleus.
                                                                                                                                                                                                                                                                                                                                                                     2 DSFYIRVNLAMEGRAKGELQVHCNEVLHVTDTMFQG-CGCWHAHRVNSYTMKDTAAHGTI 60

                                                                                                                                                                                                                                                                                                               The invention relates to stomach cancer-expressed genes (AAI93442-AAI9917) and the encoded proteins (AAM93967-AAM94039). The GAAI934A2-AAI99317) and the encoded proteins for screening for the early stages of the disease. The proteins and peptides can be used as targets for screening for compounds to treat the disease. They can also be used for predicting micro-metastases. The gene can predict peritoneal dissamination.

The present invention describes primer sets for synthesising 5602 [ull-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide comprises at least 15 nucleotides, or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 1'-end sequence of an oligonucleotide comprises at least 15 nucleotides where the oligonucleotide which comprises at a 3'-end sequence of the combination of the specification. The primer sets can be used in antisense therapy and in gene therapy. The primer sets can be used in antisense therapy and in gene therapy. The primer sets can be used in antisense therapy and the full-length cDNAs. The primers are also useful for the particularly full-length cDNAs. The primers are also useful for the chetction and/or diagnosis of the abnormality of the full-length cDNAs are primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH13628 and AAH13633 to AAH13632 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; kinase; enzyme; PKIN-13 protein; immune system disorder; anaemia; acquired immune deficiency syndrome; thymic hypoplasia; Crohn's disease; asthma; neurological disorder; eplilepsy; Charcot-Marie-Tooth disease; AIDS; seizures; cell proliferative disorder; cancer; adenocarcinoma; leukaemia; lymphoma; melanoma; myeloma; sarcoma; developmental disorder; Down's syndrome; gene therapy; protein therapy; cytostatic.

The present invention relates to human kinases (PKIN) and polynucleotides encoding such proteins. PKIN sequences of the invention are useful for diagnosing, treating or preventing disorders associated with aberrant expression of PKIN, particularly immune system disorders (e.g. acquired immune deficiency syndrome (AIDS), thymic hypoplasia, Crohn's disease, anaemia, neurological disorders (e.g. epilepsy, Charoct-Marie-Tooth disease or seizures), call proliferative disorders (e.g. cancers such as adenocarcinoma, leukaemia, lymphoma, melanoma, myeloma, sarcoma), and developmental disorders (e.g. Down's syndrome). They are also used in gene therapy and protein therapy. The present sequence is human
